Overview

MKM ValidationEngine allows organisations to implement their own business rules within existing software applications such as Patient Administration Systems. It helps align systems more completely with an organisation's business processes and data validation rules, and allows additional 'edit checks' to be introduced that ensure the correct data is entered 'at source'.

This solution provides a quick to implement and non-intrusive overlay that monitors data entry and allows an additional layer of site defined business rules to be applied to entered data. Once the MKM ValidationEngine framework is installed it is simple to implement new business rules.

MKM ValidationEngine™ builds on existing Patient Administration System and other ICT investments, integrating seamlessly with hospital systems and work practices.

Benefits

It has been proven that by helping users enforce appropriate business rules, the solution will deliver significant benefit and cost saving, including;

- Revenue savings through valid data capture (for example, capturing the correct funding arrangement, or by making this step mandatory)
- Removing the need for significant manual intervention in rectifying and re-keying data issues on an ongoing basis
- More accurate data, captured at source by the end user for operational, management and strategic reporting
- More timely delivery of statutory and other extracts
- Avoiding the need to develop or maintain validation reports and separate software packages to check and manage the quality of data
- Reduced training required for end users

Implementation

A typical project will be completed over a six-week duration and will not require any upgrades to the core application.
